VOICE AGENT GUARDRAILS

The prompt says don't. *The code* makes sure.

Five rules my AI phone agent can't talk its way out of.

SWIPE →

RULE 1

No booking before *checking the schedule.*

```
book_job(tomorrow, 2-4)
refused: check_slots first
check_slots(tomorrow)
open windows returned
```

In some test calls the model tried to book too early. The code refused every time, and the bot checked the schedule as it should.

RULE 2

One booking per call. *Never someone else's job.*

A second booking on the same call is refused. A change moves the caller's own booking instead of creating a new one, and a job that belongs to another caller can't be edited.

RULE 3

No transfer *without a reason.*

Every hand-off carries a reason and a summary. Emergencies come with safety advice first:

- Gas smell: leave the house, call the gas company or 911, then transfer.
- Burst pipe or flooding: shut-off valve first, then transfer.

RULE 4

Prices and facts *only from the business.*

The call-out fee comes from the business's own fact card. A question it can't answer becomes a saved callback request, not a guess.

RULE 5

Caller tricks *don't change the rules.*

- A caller claiming an owner's discount and a free call-out.
- A caller trying to override the instructions.

Both are among the 19 scenarios graded on every test run.

HOW IT'S CHECKED

Rules in code. *Checked by tests.*

57 / 57

best of the last 3 text runs
(56, 56, 57 of 57)

98

unit tests, run in CI on every push
